

1. Selenium allows a programmer to simulate GUI interactions in a way that can be repeated identically every time. This allows for very precise testing with the fewest surprises possible.
2. Selenium is not supported in browsers other than Firefox. While this is not really a disadvantage, it does mean you cannot thoroughly test a web site using Selenium alone.
3. `<tr><td>My Case </td></tr>`
4. `<tr><td>click</td><td></a[@id='myLink']/></td></tr>`
5. HTML is widely used and well supported by all browsers; there are no obvious drawbacks that I can think of.
